

LOFT INSULATION

(Knauf Earthwool 44)

Keeping your home warm is entirely dependent on the amount of insulation installed in the loft area. To retain as much heat as possible, the government requires at least 270mm of loft insulation to be installed.

Many people get confused as loft insulation does not actually heat your home but in fact retains the heat inside the home for a longer period. This means a reduction in energy consumption due to the heat being retained and the property remaining warmer for longer.

BENEFITS

- Helps to reduce your homes carbon footprint.
- Save money on monthly/annual energy bills.
- Improve the EPC rating on your property.
- This insulation is fibre free and anti-bug repellent which will help remove any nesting species.
- Property remains warmer for a longer period

Did you know that 25% of the heat you generate is lost through the roof?

Insulating your loft is a simple, quick, and effective way to prevent heat loss that can save you up to £250 on your energy bills per year. VerdantGreen Ltd takes pride in ourselves and our installers, who are all highly qualified. We ensure that every job is completed to a high standard, reducing all hazard risks in the loft.
