

HOME VENTILATION

(Mechanical Extractor Ventilation & Trickle Vents)

Mechanical Extract Ventilation (MEV) refers to both centralised and de-centralised systems which provide ventilation helping to reduce excess moisture using either a multi-point extract or single fans in wet rooms. MEV systems provide year-round good indoor air quality, protecting your home from condensation, damp and mould.

Trickle Vents are a very small ventilation device that is fitted on the top of windows to allow for a small but consistent, influx of fresh, clean air into your property. This helps ensure that your interior can benefit from a continual amount of comfortable ventilation without ever needing to open your windows or doors.

BENEFITS

- Reducing Condensation / Dampness
- Easy Installation
- Low Energy Operation
- Healthier Living Environment (gets rid of musty odours)
- Low Running Costs
